

# Subdivided Module Catalogue for the Subject

# Physics International

as a Master's with 1 major  
with the degree "Master of Science"  
(120 ECTS credits)

Examination regulations version: 2024  
Responsible: Faculty of Physics and Astronomy

## Learning Outcomes

German contents and learning outcome available but not translated yet.

After having successfully completed their studies the graduates fulfil the following requirements:

- The graduates are highly skilled in abstract thinking, they are able to think analytically, they have a high problem-solving competence and are able to structure complex interrelations.
- The graduates have a wide overview of the different areas of physics and of connections to other sciences.
- They have profound knowledge of the mathematical and theoretical basics of physics as well as profound knowledge of the theoretical and experimental methods to gain new insights.
- They are able to transfer their abilities and expertise to research projects and know the current state of research in at least one speciality.
- With the help of primary literature, especially in English, they are able to become acquainted with the current state of research in a speciality.
- They have the ability to independently apply physical and mathematical methods to concrete experimental or theoretical physical tasks, to develop solutions and to interpret and assess the results.
- Even with incomplete information they are in a position to work independently on physical problems, applying scientific methods and following the rules of good scientific practice, and to present, assess and attend to the results and consequences of their work.
- They are able to discuss physical topics on the current state of research with other physicists and also to explain connections to physics to non-scientists.
- As physicists they are able to work in or even lead interdisciplinary and international teams with (natural) scientists and/or engineers in research, industry and economy.

### Scientific qualification

- The graduates have profound knowledge of the mathematical, experimental and theoretical basics of physics
- The graduates can resort to profound knowledge of the theoretical and experimental methods to gain new insights
- The graduates have a wide overview of the different areas of physics
- The graduates know scientific areas adjacent to physics and realise interdisciplinary connections.
- The graduates are highly skilled in abstract thinking, they are able to think analytically, they have a high problem-solving competence and are in a position to structure complex interrelations.
- The graduates transfer their abilities and expertise to research projects and know the current state of research in at least one speciality.
- The graduates are able to discuss physical topics on the current state of research with other physicists.
- The graduates are in a position to independently apply physical and mathematical methods to concrete experimental or theoretical physical tasks, to develop solutions and to interpret and assess the results.
- With the help of primary literature, especially in English, the graduates are able to become acquainted with the current state of research in a speciality.

### Qualification to start a job

- Even with incomplete information the graduates are in a position to work independently on physical problems, following the rules of good scientific practice, and to present, assess and attend to the results and consequences of their work.

- As physicists the graduates are able to work in or even lead interdisciplinary and international teams with (natural) scientists and/or engineers in research, industry and economy.
- The graduates have the ability to independently apply physical and mathematical methods to concrete experimental or theoretical physical tasks, to develop solutions and to interpret and assess the results.
- The graduates are able to transfer their abilities and expertise to research projects and know the current state of research in at least one speciality.

#### **Self-development**

- Even with incomplete information the graduates are in a position to work independently on physical problems, and to present, assess and attend to the results and consequences of their work.
- The graduates know the rules of good scientific practice and take them into account

#### **Qualification for social commitment**

- The graduates are able to critically reflect scientific developments and to capture their impact on economy, society and environment. (technological impact assessment)
- The graduates have enlarged their knowledge concerning economic, social, natural scientific or cultural questions (to name but a few) and are able to attend to their views reasonably.
- The graduates are able to discuss physical topics on the current state of research with other physicists and also to explain physical correlations to non-scientists.
- The graduates have developed the willingness and ability to show their skills in participative processes and actively contribute to decisions.

Abbreviations used

Course types: **E** = field trip, **K** = colloquium, **O** = conversatorium, **P** = placement/lab course, **R** = project, **S** = seminar, **T** = tutorial, **Ü** = exercise, **V** = lecture

Term: **SS** = summer semester, **WS** = winter semester

Methods of grading: **NUM** = numerical grade, **B/NB** = (not) successfully completed

Regulations: **(L)ASPO** = general academic and examination regulations (for teaching-degree programmes), **FSB** = subject-specific provisions, **SFB** = list of modules

Other: **A** = thesis, **LV** = course(s), **PL** = assessment(s), **TN** = participants, **VL** = prerequisite(s)

Conventions

Unless otherwise stated, courses and assessments will be held in German, assessments will be offered every semester and modules are not creditable for bonus.

Notes

Should there be the option to choose between several methods of assessment, the lecturer will agree with the module coordinator on the method of assessment to be used in the current semester by two weeks after the start of the course at the latest and will communicate this in the customary manner.

Should the module comprise more than one graded assessment, all assessments will be equally weighted, unless otherwise stated below.

Should the assessment comprise several individual assessments, successful completion of the module will require successful completion of all individual assessments.

In accordance with

the general regulations governing the degree subject described in this module catalogue:

**ASPO2015**

associated official publications (FSB (subject-specific provisions)/SFB (list of modules)):

**06-Sep-2023 (2023-70)**

**12-Jun-2024 (2024-75)**

This module handbook seeks to render, as accurately as possible, the data that is of statutory relevance according to the examination regulations of the degree subject. However, only the FSB (subject-specific provisions) and SFB (list of modules) in their officially published versions shall be legally binding. In the case of doubt, the provisions on, in particular, module assessments specified in the FSB/SFB shall prevail.

The subject is divided into

| Abbreviation  | Module title   | ECTS credits | Method of grading | page |
|---|--|--------------|-------------------|------|
| <b>Electives Field (60 ECTS credits)</b>            |  |              |                   |      |
| <b>Subfield Physics (55 ECTS credits)</b>           |  |              |                   |      |
| <b>Advanced Laboratory Courses (9 ECTS credits)</b> |  |              |                   |      |
| 11-P-FM1-Int-201-m01                                | Advanced Laboratory Course Master Part 1                     | 3            | B/NB              | 108  |
| 11-P-FM2-Int-201-m01                                | Advanced Laboratory Course Master Part 2                     | 3            | B/NB              | 109  |
| 11-P-FM3-Int-201-m01                                | Advanced Laboratory Course Master Part 3                     | 3            | B/NB              | 110  |
| 11-P-FM4-Int-201-m01                                | Advanced Laboratory Course Master Part 4                     | 3            | B/NB              | 111  |
| <b>Advanced Seminar (5 ECTS credits)</b>            |  |              |                   |      |
| 11-OSP-A-Int-201-m01                                | Advanced Seminar Physics A                                   | 5            | NUM               | 106  |
| 11-OSP-B-Int-201-m01                                | Advanced Seminar Physics B                                   | 5            | NUM               | 107  |
| <b>Experimental Physics (10 ECTS credits)</b>       |  |              |                   |      |

| Contents  |                   |  |                  |
| Material properties of metals and ceramics: Structur-property relationships through experiments and simulation.   |                   |  |                  |
| Intended learning outcomes  |                   |  |                  |
| The students gain fundamental knowledge about the properties of modern materials: aviation aluminum alloys and high performance ceramics. Analytical methods and predictions through numerical simulations will be presented. The relationship of mikro- and nanoscopic structure of materials and the resulting properties are emphasized. |                   |  |                  |

| Duration   | Module level   | Other prerequisites  |
| 1 semester   | graduate   | Prior completion of modules o8-PCM1a and o8-PCM1b recommended. |
| Contents   |  |  |
| This module discusses advanced topics in ultrafast spectroscopy and quantum control. It focuses on ultrashort laser pulses, time-resolved laser spectroscopy and coherent control.   |  |  |
| Intended learning outcomes   |  |  |
| Students are able to describe the generation of ultrashort laser pulses and to characterise them. They can explain the theory of time-resolved laser spectroscopy and name experimental methods. They can describe the principles and applications of quantum control.   |  |  |

| Contents   |  |                                      |
| With the knowledge of basic programming, taught in introductory lectures, it is possible to realize simpler programs. If more complex problems are to be tackled, suboptimal results like long, incomprehensible functions and code duplicates occur. In this lecture, further knowledge is to be conveyed on how to give programs and code a sensible structure. Also, further topics in the areas of software security and parallel programming are discussed.   |  |                                      |
| Intended learning outcomes   |  |                                      |
| Students learn advanced programming paradigms especially suited for space applications. Different patterns are then implemented in multiple languages and their efficiency measured using standard metrics. In addition, parallel processing concepts are introduced culminating in the use of GPU architectures for extremely quick processing.   |  |                                      |

| <p>The aim of the module is to convey a fundamental understanding of imaging methods using examples from modern astronomy, incorporating measurements from ground- and space-based instruments. The students acquire the following qualifications: ability to process and interpret raw-image data, to perform data reduction, image analysis, application and improvement of processing algorithms. The concepts and methods are not limited to the field of astronomy but applicable to many other areas.</p>  |                   |                                      |

| In this lecture, selected topics of condensed matter theory are addressed. We intend to present new developments to bring the students in touch with actual research topics. Possible subjects are many-body localization and dynamic quantum matter.   |                   |                                      |
| Intended learning outcomes  |                   |                                      |
| The students learn how to describe condensed matter systems in presence of disorder and interactions from a theoretical point of view. This happens on the basis of analytical and numerical methods. Therefore, we envisage a smooth crossover of these students to the next step of becoming a researcher.  |                   |                                      |

| Duration   | Module level      | Other prerequisites                  |
| 1 semester   | graduate          | --                                   |
| Contents   |                   |                                      |
| Introduction to generic imaging concepts and physical imaging methods covering the most central aspects across all imaging modalities, including 1) the concept of Fourier imaging, 2) tomography (Radon-Transformation, central-slice- theorem), 3) the system theory of imaging systems, and 4) issues of image quality (point-spread function, modulation transfer function, spatial resolution, contrast, noise). During the course different advanced methods for image acquisition will be covered and a comprehensive overview of modern imaging modalities in biomedicine, material science and astrophysics will be given.  |                   |                                      |
| Intended learning outcomes   |                   |                                      |
| The students know the physical foundations of imaging methods and their applications. They understand the principles of image formation and are able to explain the different methods and to interpret simple images.  |                   |                                      |

| <p>This advanced course focuses on the details of modern computed tomography (CT), which is employed both in medical and industrial imaging applications. In addition to the technicalities of CT systems and their application to various tasks in engineering and medical science, this lecture emphasizes on the mathematics of “inverting the Radon transform”. Starting with the simple Filtered Back Projection method which is applied to a variety of standard recording geometries (parallel, fan, cone, helix) the advanced course lays out the strategies for algebraic reconstruction techniques (ART) along with many types of regularization schemes which may accompany these methods. Students will have the opportunity to see how Radon data is recorded and how different error sources as well as the corresponding correction schemes influence the outcome of the reconstructed volume images. Finally the most common tools for volume image analysis are presented, such as distance transforms, watersheds, labelling and fiber orientation analysis.</p> |                   |                                      |
| Intended learning outcomes   |                   |                                      |
| <p>The student know the concept of Computed tomography (CT) and its applications. From the formulation of the basic inverse problem posed by this technique the students are able to derive strategies for different numerical solutions, based on Fourier analysis and/or based on probability theory. Most importantly the students have a firm impression (first-hand experience) of the various sources of measurement errors in CT which can impede any well-prepared reconstruction.</p>   |                   |                                      |

|---|
| <b>Intended learning outcomes</b>   |
| Thorough understanding of the foundations of gauge/gravity duality and the ability to carry out basic tests. Working knowledge of essential applications. Knowledge of quantum mechanics and classical electrodynamics is a prerequisite for this course. Knowledge of quantum field theory and general relativity will be useful, however is not a prerequisite.   |

| Semiconductor Nanostructures are frequently referred to as 'artificial materials'. In contrast to atoms, molecules or macroscopic crystals, their electronic, optical and magnetic properties can be systematically tailored via changing their size. The lecture addresses technological challenges in the preparation of semiconductor nanostructures of varying dimensions (2D, 1D, 0D). It provides the basic theoretical concepts to describe their properties, with a focus on optical properties and light-matter coupling. Moreover, it discusses the challenges and concepts of novel optoelectronic and quantum photonic devices based on such nanostructures, including building blocks for quantum communication and quantum computing architectures  |  |                                      |
| Intended learning outcomes  |  |                                      |
| Familiarity with the fundamental properties of semiconductor nanostructures as well as with their theoretical foundations. Knowledge of the technological methods to fabricate such structures, and of their applications to novel photonic devices.  |  |                                      |

| The lecture deals with the fundamental properties of semiconductors. It begins with an analysis of the crystal structure, leading to methods for describing band structures. These form a basis for discussing optical and electronic properties of monolithic semiconductors. It then turns to examining semiconductor heterostructures, and studies how these can be used to modify and design optical and electrical properties, especially in the case of lowered dimensionality systems. Examples are selected from current research activities.   |  |                                      |
| Intended learning outcomes  |  |                                      |
| To provide the student with a working knowledge semiconductors pertaining to crystal structure, symmetries, and band structures, as well as electrical and optical properties. This establishes a solid basis preparing him for the more targeted specially lectures in the program.  |  |                                      |

| <p>Conformal field theory (CFT), as developed in the 1980s, finds immediate applications in string theory and two-dimensional statistical mechanics, where critical exponents and correlation functions for many models (Ising, tricritical Ising, 3-state Potts, etc.) can be calculated exactly. The physical idea is that the principle of scale invariance is elevated from a global to a local invariance, which for reasons of consistency amounts to invariance under conformal transformations. This, in turn, yields a rich and fascinating mathematical structure for two dimensional systems (either two space or one time and one space dimension). CFT has become relevant to many interesting areas of condensed matter physics, including Abelian and non-Abelian bosonization, quantized Hall states (where the bulk wave function is described in terms of conformal correlators, and the edge in terms 1+1 dimensional CFTs), the two-channel Kondo effect, fractional topological insulators, and in particular fault-tolerant topological quantum computing involving non-Abelian anyons (Ising and Fibonacci anyons, for example, owe their names to the fusion rules of the associated conformal fields.) A potential syllabus for the first term of the course is:</p> <p>0 Introduction (scale and conformal invariance, critical exponents, the transverse Ising model at the self-dual point)</p> <p>1 Conformal theories in D dimensions (conformal group, conformal algebra in 2D, constraints on correlation functions)</p> <p>2 Conformal theories in D=2 (primary fields and correlation functions, quantum field theory, canonical quantization and Noether's theorem, radial quantization and Polyakov's theorem, time ordering and functional integration, the free boson and vertex operators, conformal Ward identities)</p> <p>3 The central charge and the Virasoro algebra (central charge, the Schwarzian derivative, the free fermion, (Abelian) bosonization, mode expansions and the Virasoro algebra, the cylinder geometry and the Casimir effect, in- and out-states, highest weight states, descendant fields and operator product expansions, conformal blocks, duality and the bootstrap)</p> <p>4 Kac determinant and unitarity (Verma modules and null states, Kac determinant formula, non-unitarity proof, conformal grids, minimal models in general)</p> |                   |  |                    |

| <p>Nuclear magnetic resonance (NMR) is a quantum mechanical phenomenon that, through magnetic resonance imaging (MRI), has played a major role in the revolution in medical imaging over the last 30 years. Starting from the fundamentals of nuclear magnetic resonance (resonance principle, relaxation times, chemical shift) this course covers</p> <ol style="list-style-type: none"> <li>1) the NMR signal theory and signal evolution (Bloch equations)</li> <li>2) the principles of spatial encoding, magnetic resonance imaging (MRI) and corresponding imaging sequences and measurement parameters,</li> <li>3) the concept of k-space and Fourier imaging,</li> <li>4) the physical, methodological and technical possibilities and limitations of MRI. Finally, typical application fields of MRI in biomedical research, clinical imaging and non-destructive testing will be covered.</li> </ol> |                   |                                      |
| Intended learning outcomes   |                   |                                      |
| <p>The students are familiar with the basics and the deepened aspects of NMR and MRI including the mathematical-theoretical description and the physical basics of modern MRI, MRI-instrumentation and image-formation/image-processing principles. The students gain a deep insight into the area of modern MRI and its interdisciplinary relations and applications.</p>   |                   |                                      |

| <p>The lecture conveys theoretical fundamentals, experimental techniques, and applications of nano-optics starting from the discussion of the focusing of light. Based on this, the fundamentals of modern far-field optical microscopy are discussed. In the following, the near-field optical microscopy is introduced and discussed. As a further basis, quantum emitters are introduced and their light emission in nano-environments is derived. Plasmons in 2D, 1D and 0 dimensions are introduced and discussed in detail. This finally leads to the concept of optical antennas.</p>  |  |                                      |

| Contents  |                   |  |                    |
| Basic Properties of Superconductors and their Applications, Development of technological platforms, Methods of material science for calculating temperature profiles in superconductors. Overview of the phenomenology of conventional and unconventional superconductivity. Review of BCS theory and its applicability for different types of superconductors. Extension of Ginzburg-Landau theory to a quantum field theory formalism using Feynman diagrams and functional integrals. Theoretical formalism of Ward identities and response functions. Goldstone modes, phase fluctuations, and coupling to the electromagnetic field. Interpretation of the Meissner effect in terms of the Higgs mechanism. Interplay of magnetism and conventional/unconventional superconductivity. Discussion of current research topics and perspective on room-temperature superconductivity. |                   |  |                    |
| Intended learning outcomes  |                   |  |                    |
| Acquisition of basic knowledge about superconductivity as a macroscopic quantum phenomenon. Profound understanding of unconventional superconductivity and its interplay with magnetism in the context of current research. Knowledge of BCS mean-field theory, the quantum-field theory methods necessary to extend BCS theory, as well as the Meissner effect and the Higgs mechanism. Basic understanding of unconventional superconductors and their fascinating connection with competing magnetic phases.   |                   |  |                    |

| Contents  |  |   |
| 1. Symmetries.<br>2. Lagrange formalism for fields.<br>3. Field quantisation.<br>4. Asymptotic states, scattering theory and S-matrix<br>5. Gauge principle and interaction.<br>6. Perturbation theory.<br>7. Feynman rules.<br>8. Quantum elektrodynamical processes in Born approximation.<br>9. Radiative corrections (optional)<br>10. Renormalisation (optional).  |  |   |
| Intended learning outcomes  |  |   |
| The students have mastered the principles and underlying mathematics of relativistic quantum field theories. They know how to use perturbation theory and how to apply Feynman rules. They are able to calculate basics processes in the framework of quantum electrodynamics in leading order. Moreover, they have a basic understanding of radiative corrections and renormalisation.   |  |   |

| <p>„Quantum mechanics 2“ constitutes the central theoretical course to be taken within the international Master's program in physics. While the specific emphasis can be adjusted individually, the core topics that are supposed to be covered should include:</p> <ol style="list-style-type: none"> <li>1. Second quantization: fermions and bosons</li> <li>2. Band structures of particles in a crystal</li> <li>3. Angular momentum, symmetry operators, Lie Algebras</li> <li>4. Scattering theory: potential scattering, partial wave expansion</li> <li>5. Relativistic quantum mechanics: Klein-Gordon equation, Dirac equation, Lorentz group, fine structure splitting of atomic spectra</li> <li>6. Quantum entanglement</li> <li>7. Canonical formalism</li> </ol>  |                   |                                      |
| Intended learning outcomes  |                   |                                      |
| <p>In-depth knowledge of advanced quantum mechanics. Thorough understanding of the mathematical and theoretical concepts of the listed topics. Ability to describe or model problems of modern theoretical quantum physics mathematically, to solve problems analytically or using approximation methods and to interpret the results physically. The course is pivotal to subsequent theory courses in astrophysics, high energy physics and condensed matter/solid state physics. The course is mandatory for all Master's students.</p>  |                   |                                      |

| <p>The lecture addresses the fundamental transport phenomena of electrons in solids where Electron-electron interaction and the wave nature are the determining factors. This includes the diffusive and ballistic transport regime as well as the Coulomb blockade. Observations of electron interference effects, conductance quantization and the quantum Hall effect will be discussed. Thermoelectric properties of electronic system and the phenomenon of superconductivity will be examined as well.</p> <p>Low dimensional electron systems and its quantum mechanical description are the basis of this lecture. Relevant material systems are semiconductor heterostructures as well as topological insulators, topological semimetals, and topological superconductors. The content will be guided by actual research results.</p> |  |                                      |

#### Intended learning outcomes

The goal of the course is the transfer of knowledge and competence in the radio interferometrical method, providing a foundation for independent research.

Concepts are taught in connection to practical examples from modern astronomy including recent measurements of radio interferometers.

Students shall gain the following specific competences: Understanding of the concept of radio interferometrical observations and their calibration.

Processing and interpretation of raw data. data reduction and analysis, applications and understanding of established algorithms.

Handling of large data volumes. The course makes use of general concepts and teaches special programming concepts that are of wide use beyond astronomy.

#### Courses (type, number of weekly contact hours, language — if other than German)

V (3) + R (1)

Module taught in: English

#### Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

a) written examination (approx. 90 to 120 minutes) or b) oral examination of one candidate each (approx. 30 minutes) or c) oral examination in groups (groups of 2, approx. 30 minutes per candidate) or d) project report (approx. 8 to 10 pages) or e) presentation/talk (approx. 30 minutes).

If a written examination was chosen as method of assessment, this may be changed and assessment may instead take the form of an oral examination of one candidate each or an oral examination in groups. If the method of assessment is changed, the lecturer must inform students about this by four weeks prior to the original examination date at the latest.

Language of assessment: English

Assessment offered: In the semester in which the course is offered and in the subsequent semester

| Contents  |                   |                                      |                     |
| <p>This course is complementary to the discussion of Wilson's renormalization group (RG) as covered in the course „Renormalization Group and Critical Phenomena“ (11-CRP). This course focuses on the diagrammatic formulation of RG flow equations and its relation to diagrammatic perturbation expansions. For interacting fermion systems, this is of particular relevance in the context of the functional renormalization group. A possible outline of the course is:</p> <ol style="list-style-type: none"><li>1. Wilson's RG</li><li>2. Path integral formulation of interacting fermions</li><li>3. Bethe-Salpeter-equation</li><li>4. RG flow equations for the one-particle and the two-particle vertex</li><li>5. Comparison of flow equations with diagrammatic resummation schemes (such as the „random phase approximation“)</li><li>6. RG flow equations for spin systems</li></ol> |                   |                                      |                     |
| Intended learning outcomes  |                   |                                      |                     |
| Familiarity with modern diagram based techniques for interacting many-body systems. In-depth understanding of the theoretical framework addressing a range of phenomena in correlated electron systems including superconductivity, charge and spin density waves, and nematic instabilities.   |                   |                                      |                     |
| Courses (type, number of weekly contact hours, language — if other than German)   |                   |                                      |                     |

| <p>This course plays a bridging role joining the basics on GR learnt in the GR I course and the active research directions in the fields of Astronomy, Astrophysics, General Relativity, String Theory and Gauge/Gravity Duality. Through this course, the students will gain sufficient commands over the applications of general relativity in connection with research directions in this area. This in turn will motivate them to pursue careers as a researcher in the aforementioned directions and help them to successful begin their Master and PhD projects.</p>  |                   |  |                    |

| ECTS   | Method of grading | Only after succ. compl. of module(s) |
| 6  | numerical grade   | --                                   |
| Duration   | Module level      | Other prerequisites                  |
| 1 semester   | graduate          | --                                   |
| Contents   |                   |                                      |
| Basic theoretical principles of scanning force, tunneling, and near-field optical microscopy; basic principles of surface science; tip-sample interactions; design principles and material considerations; fundamentals of control engineering; measurement modes, e.g., contact and non-contact, Kelvin probe, friction force microscopy, etc; basic principles of processing and presenting microcopy data; measurement techniques and their application: lock-in, phase-lock loop, etc.   |                   |                                      |
| Intended learning outcomes   |                   |                                      |
| Student acquires specific knowledge in scanning probe microscopy. He/she knows the basic theoretical principles, is aware of basic design principles, knows pros and cons of various materials, and is familiar of measurement modes, contrast mechanisms, and their application. He/she is aware of recent development in the field.  |                   |                                      |
| Courses (type, number of weekly contact hours, language — if other than German)  |                   |                                      |

| Contents  |                   |  |                      |
| Classical and quantum theory of the relativistic bosonic string, in particular the Nambu-Goto action and Polyakov action, Quantization of the closed bosonic string and emergent graviton, Quantum Lorentz invariance and critical dimension, Quantization of the open bosonic string, D-Branes, Gauge Fields and Yang-Mills Theories, Relativistic Conformal Field Theory, String Path Integral, BRST Quantization, String Interactions, Effective Actions and Gravity.  |                   |  |                      |
| Intended learning outcomes  |                   |  |                      |
| Familiarity with the classical and quantum theory of relativistic bosonic strings, in particular with the two classical actions for relativistic bosonic strings, the Nambu-Goto action and the Polyakov action. Ability to quantize the closed bosonic string and to understand the emergence of the massless graviton in the spectrum of the closed bosonic string. Knowledge of the quantum Lorentz anomaly and the derivation of the critical dimension of the bosonic string. Understanding of the boundary conditions for the open string and its connection to D-branes. Knowledge of open string quantization and the spectrum of massless gauge fields, as well as of Yang-Mills fields for coincident branes. In-depth knowledge of relativistic conformal field theory, the string path integral and its BRST quantization and the calculation of string interactions. Thorough understanding of the low-energy effective actions in target space and the emergence of Einstein gravity. |                   |  |                      |

| Superstring Theories and M Theory, in particular a short introduction to bosonic string theory, the theory of fermionic fields and representations of clifford algebra in diverse dimensions, a review of supersymmetry in two and higher dimensions, the classical and quantum version of the Ramond-Neveu-Schwarz Superstring, type 2 A/B Superstrings, the Gliozzi-Scherck-Olive Projection and Space-Time Supersymmetry in 10 dimensions, the type 1 Superstring, heterotic string theories, anomaly cancellation and restrictions on gauge groups, dualities between the five superstring theories as well as their relation to M Theory in 11D, D-Branes and supersymmetric gauge theories, supergravity and the AdS/CFT Correspondence.  |                   |                                      |                      |
| Intended learning outcomes  |                   |                                      |                      |
| In-depth knowledge of supersymmetric string theories and M Theory. Familiarity with the main features of bosonic string theory, as well as with the theory of fermionic fields and representations of Clifford algebra in different dimensions. Knowledge of supersymmetry in two and higher dimensions, as relevant for the understanding of superstring theory. Working knowledge of the classical and quantum version of the Ramond-Neveu-Schwarz Superstring. Understanding of the emergence of type II A/B Superstrings upon imposing the Gliozzi-Scherck-Olive Projection, which in particular enforces Space-Time Supersymmetry in 10D. Familiarity with the type 1 and heterotic superstring theories, as well as with anomaly cancellation in these theories and the restrictions it imposes on the allowed gauge groups. Knowledge of dualities between the five superstring theories as well as their relation to M Theory in 11D. Knowledge of the properties of D-Branes in type I and II superstring theories and the supersymmetric gauge theories they carry, of the supergravity actions in ten and eleven dimensional space-time and of the AdS/CFT Correspondence. |                   |                                      |                      |

| Contents  |                   |  |                     |
| A possible continuation of „11-TFK“ is the following syllabus:<br>5. Advanced topics of the theory of superconductivity (Bogoliubov-de Gennes equations, effective field theory, Anderson-Higgs description of the Meissner effect)<br>6. Unconventional superconductors (e.G. copper-oxide high-Tc superconductors)<br>7. Green's function methods and Feynman diagrammatic technique<br>8. The Kondo Effect (Anderson's “poor mans scaling“, renormalization group)   |                   |  |                     |
| Intended learning outcomes  |                   |  |                     |
| Advanced knowledge of the topics listed above. In-depth understanding of both the concepts involved and ability to apply the methods listed. This provides a thorough working knowledge of a large number of topics treated in the standard textbooks on theoretical solid state physics.   |                   |  |                     |

| Intended learning outcomes   |  |                                      |
| Comprehensive understanding of phenomena involving light and its interaction with atoms at the microscopical level. Knowledge of density matrix formalism for quantum systems and the related mathematical concepts. In-depth understanding of quantum properties of light and their experimental signatures, including photon statistics and correlations. Knowledge of the theory of open systems and master equation description involving Lindblad superoperators. Understanding and modeling the role of coherence and interference in light propagation effects in resonant atomic media. Knowledge of cooperative effects in many-body systems: super- and subradiance, collective light shifts and their applications.   |  |                                      |
