- SUSY models contain many scalars  $\Rightarrow$  complicated potential
- usually some parameters ( $\mu, B$ ) are chosen to obtain correct EWSB
- does not exclude the existence of other minima breaking charge and/or color!

$$M_{1/2} = 1 \text{ TeV}, \tan \beta = 10, \mu > 0$$

keep only SUSY particles light needed for ‘natural Higgs’:

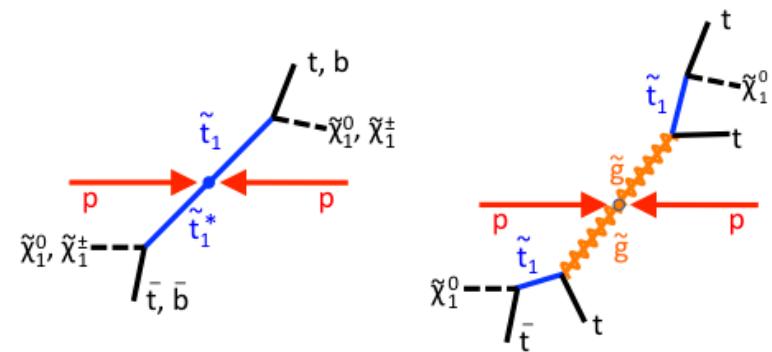

$$\tilde{t}_1, \tilde{b}_1, \tilde{g}, \tilde{\chi}_1^0, \tilde{\chi}_1^+ \simeq \tilde{h}_{1,2}^0, \tilde{h}^+ \simeq \tilde{h}^+$$

$$\Rightarrow 100 \text{ MeV} \lesssim m_{\tilde{\chi}_1^+} - m_{\tilde{\chi}_1^0} \simeq m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} \lesssim 5 - 10 \text{ GeV}$$

$$\tilde{g} \rightarrow \tilde{t}_1 t, \tilde{b}_1 b$$

$$\tilde{t}_1 \rightarrow t \tilde{\chi}_1^0, b \tilde{\chi}_1^+, W^+ \tilde{b}_1$$

$$\tilde{b}_1 \rightarrow b \tilde{\chi}_1^0, t \tilde{\chi}_1^-, W^- \tilde{t}_1$$

BRs depend on the nature of  $\tilde{t}_1$  and  $\tilde{b}_1$

Higgsino mass:  $\mu + \mu'$  with soft SUSY breaking parameter:  $\mathcal{L} = -\mu' \tilde{H}_d \tilde{H}_u$

- additional D-term contributions to  $m_h$  at tree-level

extra  $U(1)_\chi$ :  $m_{h,tree}^2 \leq m_Z^2 + \frac{1}{4}g_\chi^2 v^2$

- Origin of  $R$ -parity  $R_P = (-1)^{2s+3(B-L)}$

$\Rightarrow SO(10) \rightarrow SU(3)_C \times SU(2)_L \times SU(2)_R \times U(1)_{B-L}$

$\rightarrow SU(3)_C \times SU(2)_L \times U(1)_R \times U(1)_{B-L}$

$\cong SU(3)_C \times SU(2)_L \times U(1)_Y \times U(1)_\chi$

or  $E(8) \times E(8) \rightarrow SU(3)_C \times SU(2)_L \times U(1)_Y \times U(1)_{B-L}$

- Neutrino masses

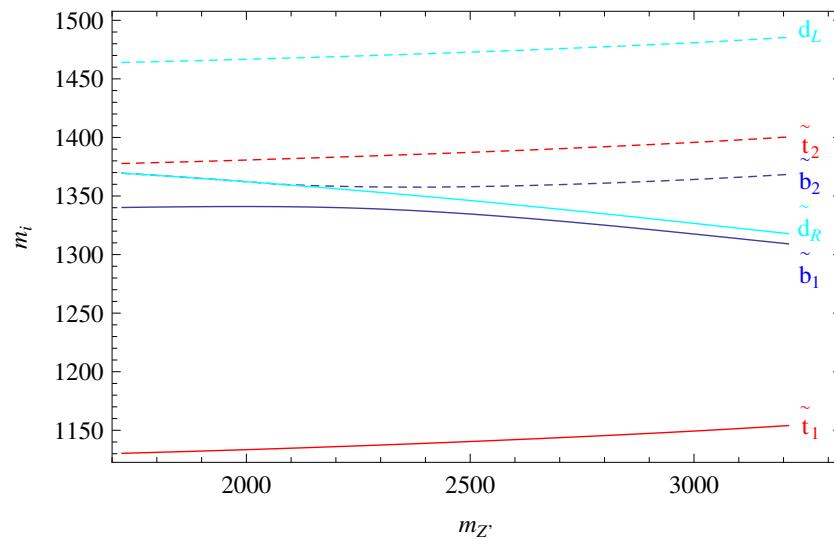

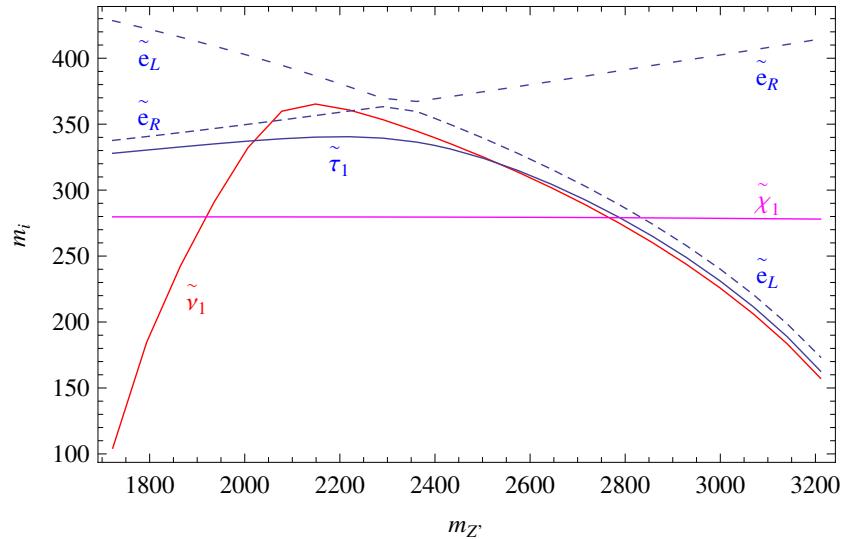

$B - L$  anomaly free  $\Rightarrow \nu_R$

$$M_{\tilde{l}}^2 = \begin{pmatrix} M_{\tilde{L}}^2 + D_L + m_l^2 & \frac{1}{\sqrt{2}}(v_d T_l - \mu Y_l v_u) \\ \frac{1}{\sqrt{2}}(v_d T_l - \mu Y_l v_u) & M_{\tilde{E}}^2 + D_R + m_l^2 \end{pmatrix},$$

$$D_L \simeq (-\frac{1}{2} + \sin^2_{\theta_W}) m_Z^2 c_{2\beta} - \frac{5}{4} m_{Z'}^2 c_{2\beta_R} \text{ and } D_R \simeq -\sin^2_{\theta_W} m_Z^2 c_{2\beta} + \frac{5}{4} m_{Z'}^2 c_{2\beta_R}$$

neglecting gauge kinetic effects; similarly for squarks

$$m_0 = 100 \text{ GeV}, m_{1/2} = 700 \text{ GeV}, A_0 = 0, \tan \beta = 10, \mu > 0$$

$$\tan \beta_R = 0.94, m_{A_R} = 2 \text{ TeV}, \mu_R = -800 \text{ GeV}$$

- LHC:  $m_h \simeq 125$  GeV, no conclusive BSM physics found  $\Rightarrow$ 
  - GMSB, CMSSM, NUHM:  $m_{\tilde{g}}, m_{\tilde{q}} \gtrsim 2$  TeV
  - CMSSM, NUHM: large  $A_0$ , danger of color and charge breaking minima
- general MSSM: SUSY particles with masses of few 100 GeV still allowed if spectra compressed, in particular light  $\tilde{t}_1$  still allowed
- ‘Natural SUSY’: take only those states light which contribute to EWSB:  $\tilde{h}^{0,\pm}, \tilde{t}_1, \tilde{g}, \tilde{b}_i$   
disadvantage: cannot explain dark matter relic density
- ‘Natural SUSY’ +  $\tilde{\nu}_R$ 
  - $\tilde{\nu}_R$  LSP: compatible with DM, no direct DM constraint apply
  - $m_{\tilde{h}^+} \lesssim 400$  GeV excluded if  $m_{\tilde{h}^+} - m_{\tilde{\nu}_R} \gtrsim 150$  GeV
  - independent of other parameters:  $m_{\tilde{t}_1} \lesssim 300$  GeV excluded except for very compressed spectra (8 TeV data only)
  - for  $300 \text{ GeV} \lesssim m_{\tilde{t}_1} \lesssim 800 \text{ GeV}$ : exclusion depends on parameters, in particular on  $\cos \theta_{\tilde{t}}$  (8 TeV data only)
