Holography for $\mathcal{N} = 1$ SQFT and the uplift of GPPZ solution

Kostas Skenderis

Gauge/Gravity Duality 2018 Würzburg, Germany 2 August 2018 $\label{eq:N} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Introduction

- > The best understood holographic duality is that between $\mathcal{N} = 4$ SYM and $AdS_5 \times S^5$.
- Since the early days of AdS/CFT, a significant effort was devoted to obtain holographic dualities involving non-conformal theories with reduced supersymmetry.
- > Here we will address this problem systematically for $\mathcal{N} = 1$ deformations of $\mathcal{N} = 4$ SYM ...
- > ... and then analyze the case of $N = 1^*$ SYM.

 $\label{eq:N} \begin{array}{l} \mbox{Introduction}\\ \mbox{From QFT to SUGRA}\\ \mathcal{N}=1 \mbox{ deformations of } \mathcal{N}=4 \mbox{ SYM}\\ \mbox{GPPZ solution and its uplift}\\ \mbox{Conclusions} \end{array}$

The first part of the talk is based on

> Stanislav Schmidt, KS, $\mathcal{N} = 1$ deformations of $\mathcal{N} = 4$ SYM and SUGRA potentials, 18xx.xxxxx

The last part is based on

Deforming holographic dualities

- ➢ Recall that 1/2 BPS operators O_∆ of holographic SCFTs correspond to bulk supergravity fields φ
- We can use these operators to deform the SCFT to a SQFT:

$$L_{CFT} \rightarrow L_{QFT} = L_{CFT} + \phi_0 \mathcal{O}_\Delta$$

> The bulk description is in terms of a domain-wall spacetime,

$$ds^{2} = dr^{2} + e^{2A(r)}dx^{i}dx^{i}$$

$$\phi = \phi(r)$$

where $A(r) \to r, \phi(r) \to e^{(d-\Delta)r}\phi_0$ as $r \to \infty$.

> The same type of spacetime but with $A(r) \rightarrow r, \phi(r) \rightarrow e^{-\Delta r} \phi_{\Delta}$ as $r \rightarrow \infty$ describes the dual to a QFT with a condensate, where now $\langle O_{\Delta} \rangle \sim \phi_{\Delta}$.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

 $\label{eq:model} \begin{array}{l} \mbox{Introduction} \\ \mbox{From OFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Fake supergravity

> Assuming $\phi(r)$ is invertible, there is a first order formulation:

$$\dot{A}(r) = -\frac{1}{d-1}W(\phi), \qquad \dot{\phi} = \partial_{\phi}W(\phi)$$

where $W(\phi) = -(d-1)\dot{A}(r(\phi))$ is the fake superpotential.

> The potential $V(\phi)$ is then given in terms of $W(\phi)$ by

$$V(\phi) = -\frac{1}{2} \left(\frac{d}{d-1} W^2 - (\partial_{\phi} W)^2 \right)$$

- Theories with such potential enjoy a positive energy theorem. [Boucher (1984)] [Townsend (1984)]
- This then implies that the domain-wall solution is perturbatively (and often non-perturbatively) stable. [KS, Townsend (1999)(2006)], [Freedman, Nuñez, Schnabl, KS (2003)]

 $\label{eq:model} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplit} \\ \mbox{Conclusions} \end{array}$

Obtaining the potential from QFT

> In holographic RG flows, the beta function given by

$$\beta(r) = \frac{1}{d-1} \frac{\partial \ln W(\phi)}{\partial \phi}$$

where r is associated with the energy scale of the QFT.

- > Suppose now we know $\beta(r)$ exactly.
- Then the field equation and the holographic beta function can be integrated to give:

$$W(r) = -\frac{1}{(d-1)^2 \int^r dr \beta(r)^2}, \quad \phi(r) = \pm (d-1) \int^r dr \beta(r) W(r)$$

 $\label{eq:model} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Obtaining the potential

> Inverting $r = r(\phi)$ we obtain $W(\phi) = W(r(\phi))$ and from here we find the potential $V(\phi)$,

$$V(\phi) = -\frac{1}{2} \left(\frac{d}{d-1} W^2 - (\partial_{\phi} W)^2 \right)$$

> Summary:

Given the beta function we can obtain the potential.

So ... when do we know the beta function exactly?

 $\label{eq:model} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplit} \\ \mbox{Conclusions} \end{array}$

N = 1 supersymmetric non-renormalization theorems

- In supersymmetric theories, the superpotential does not renormalize.
- Suppose we modify the superpotential

$$W \to W + \phi \hat{O}$$

where \hat{O} is a chiral superfield. Then the beta function for the coupling ϕ is

$$\beta_{\phi} = \frac{d\phi(\mu)}{d\ln\mu} = (-d + (\Delta + \gamma_O))\phi(\mu)$$

where Δ is the classical dimension of the F-term of \hat{O} and γ_O is its anomalous dimension.

 $\label{eq:started} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Beta function

If Ô has protected dimension, then we can readily integrate the beta function,

$$\frac{d\phi(\mu)}{d\ln\mu} = (-d + \Delta)\varphi(\mu) \qquad \Rightarrow \qquad \phi(\mu) = \phi_0 \exp(-(d - \Delta)\ln\mu)$$

> In holography, $\ln \mu \leftrightarrow r$, and the beta function is

$$\beta(r) = -(d - \Delta)\phi_0 \exp(-(d - \Delta)r)$$

 $\label{eq:static} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Bulk potential

 Inserting in our previous formulae we obtain the fake superpotential

$$W(\phi) = -\frac{-(d-1)}{2} \left(\cosh\left(\frac{2\phi}{\alpha}\right) + 1 \right), \qquad \alpha^2 = \frac{2(d-1)}{d-\Delta}$$

> ... and the potential,

$$V(\phi) = \frac{d-1}{4\kappa^2} \cosh^2\left(\frac{\phi}{\alpha}\right) \left[(d-2\Delta) \cosh\left(\frac{2\phi}{\alpha}\right) - (3d-2\Delta) \right]$$

 $\label{eq:model} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Explicit realization

- > Consider $\mathcal{N} = 4 SU(N)$ SYM. Its 1/2 BPS operators have no anomalous dimension.
- N = 4 SYM may be expressed in an N = 1 language and some of the 1/2 BPS operators are F-terms from the perspective of the N = 1 theory.
- > Deform $\mathcal{N} = 4$ SYM using any of these operators.

 $\label{eq:maintender} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

$\mathcal{N}=4$ in $\mathcal{N}=1$ language

- > The field content of $\mathcal{N} = 4$ SYM in terms of $\mathcal{N} = 1$ multiplets consist of three chiral superfields Z_i and one vector multiplet V.
- > The $SU(4)_R$ R-symmetry is correspondingly broken to $SU(3) \times U(1)_R$.
- The action is given by

$$S_{\mathcal{N}=4} = \int d^2\theta d^2\bar{\theta} \ K(e^V Z, \bar{Z}) + \left(\int d^2\theta \ (f(Z)W^{\alpha}W_{\alpha} + \mathcal{W}(Z)) + c.c. \right)$$

with

$$K(Z, \overline{Z}) \sim \operatorname{tr} \overline{Z}Z, \quad f(Z) \sim \tau, \quad \mathcal{W}(Z) \sim \epsilon^{ijk} Z_i[Z_j, Z_k]$$

 $\label{eq:matrix} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{SYM} \\ \mbox{GPPZ solution and its uplit} \\ \mbox{Conclusions} \end{array}$

Holographic $\mathcal{N} = 1$ deformations of $\mathcal{N} = 4$ SYM

- To be able to study $\mathcal{N} = 1$ deformations holographically the deformations must involve 1/2 BPS operators of $\mathcal{N} = 4$ SYM. We need to identify the (parts of the 1/2 BPS) operators that deform:
- \succ the superpotential $\mathcal{W}(Z)$
- > the gauge kinetic term f(Z)
- D-term deformations
 - In $\mathcal{N} = 1$ SQFT, the bottom components of chiral superfields may condense.
- > To study those holographically we also need to identify where these components sit in the 1/2 BPS operator of $\mathcal{N} = 4$ SYM.
 - We have classified all cases.

 $\label{eq:main_state} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{SYM} \\ \mbox{GPPZ solution and its uplit} \\ \mbox{Conclusions} \end{array}$

1/2 BPS operators of $\mathcal{N}=4$ SYM

- > Superconformal primaries are given by $\operatorname{Tr} \phi^{\{i_1} \cdots \phi^{i_p\}}$.
- The rest of the 1/2 BPS operators are obtained as super-conformal descendants.
- > p = 2 is the energy-momentum multiplet and it corresponds to the gauged supergravity multiplet.
- > p > 2 correspond to KK modes on S^5 .

 $\label{eq:main_state} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplit} \\ \mbox{Conclusions} \end{array}$

The p = 2 multiplet: $\operatorname{Tr} \phi^{\{i_1} \phi^{i_2\}}$

 $\label{eq:main_state} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Correspondence with bulk fields

 $\label{eq:main_state} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

The p = 2 multiplet: $SU(4)_R \rightarrow SU(3) \times U(1)_R$

 $\label{eq:N} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplit} \\ \mbox{Conclusions} \end{array}$

The p = 2 multiplet: $\mathcal{N} = 1$ decomposition

 $\label{eq:maintender} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

- > A particular case of this deformation yields $N = 1^*$ SYM.
- > In this case $\Delta = 3$ and the evaluating the formulae for the (super)potential we had earlier we find:

$$W = -\frac{3}{4} \left[\cosh\left(\frac{2m}{\sqrt{3}}\right) + 1 \right]$$
$$V = -\frac{3}{8} \left[\cosh^2\left(\frac{2m}{\sqrt{3}}\right) + 4 \cosh\left(\frac{2m}{\sqrt{3}}\right) + 3 \right]$$

which are precisely the superpotential and potential worked out by GPPZ.

 $\label{eq:N} \begin{array}{l} & \mbox{Introduction} \\ & \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ & \mbox{GPPZ solution and its uplift} \\ & \mbox{Conclusions} \end{array}$

- > These originate from KK modes of the $A_{\alpha\beta}$ field on S^5 .
- There must exist massive single scalar consistent truncations of IIB SUGRA with the potential given earlier.

Introduction From QFT to SUGRA $\mathcal{N} = 1$ deformations of $\mathcal{N} = 4$ SYM GPPZ solution and its uplift Conclusions

Gauge kinetic function

Gauge kinetic function

where $W^2 = W^{\alpha} W_{\alpha}$.

➤ If we deform $\mathcal{N} = 4$ SYM by the F-component of this operator, then we deform $f(Z) \rightarrow \tau + Z^{p-2}$.

 $\label{eq:N} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{SYM} \\ \mbox{GPPZ solution and its upfit} \\ \mbox{Conclusions} \end{array}$

D-term deformations

- > They appear for $p \ge 4$ and correspond to $\mathcal{N} = 1$ higher derivative terms.
- > They are characterized by harmonic functions: $\partial^i \partial_i g = 0$
- > For example,

$$\delta S = \int d^2\theta d^2\bar{\theta} \, \left(\overline{W}^2 Z_i Z_j \partial^i \partial^j g(Z_i, \bar{Z}^j) + \text{c.c.} \right)$$

 $\label{eq:N} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Condensates

- > $\mathcal{N} = 4$ SYM does not have vacua that spontaneously break $\mathcal{N} = 4 \rightarrow \mathcal{N} = 1$.
- > We can however first deform $\mathcal{N} = 4$ SYM to $\mathcal{N} = 1$ SYM, as discussed earlier. In the $N = 1^*$ case,

 $\langle W^2 \rangle \sim m^3 e^{2\pi i \tau/N}$

> In the large 't Hooft limit, $e^{2\pi i \tau/N} \rightarrow 1$. Then

$$\frac{d\langle W^2\rangle}{d\log m} = 3\langle W^2\rangle$$

> This is the analogue of the beta function for condensates.

< ロ > < 同 > < 三 > < 三 > -

 $\label{eq:N} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Fake superpotential

Using our earlier analysis, now for holographic RG flows corresponding to vevs, we find that the fake superpotential is

$$W_{\sigma} = -\frac{3}{4} \left(\cosh(2\sigma) + 1\right)$$

Combined with the fake superpotential W_m that corresponds to the deformation (found earlier), we finally get

$$W = -\frac{3}{4} \left[\cosh\left(\frac{2m}{\sqrt{3}}\right) + \cosh(2\sigma) \right]$$

and from here we can get the potential.

> This agrees exactly with the GPPZ result.

 $\label{eq:main_state} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplit} \\ \mbox{Conclusions} \end{array}$

GPPZ solution [Girardello, Petrini, Porrati, Zaffaroni (1999)]

$$\begin{split} m(y) &= \frac{\sqrt{3}}{2} \log \left[\frac{1 + e^{-(y - C_1)}}{1 - e^{-(y - C_1)}} \right], \\ \sigma(y) &= \frac{1}{2} \log \left[\frac{1 + e^{-3(y - C_2)}}{1 - e^{-3(y - C_2)}} \right], \\ A(y) &= y - \log \cosh \frac{m(y)}{\sqrt{3}} - \frac{1}{3} \log \cosh \sigma(y). \end{split}$$

- m and σ are the norms of the complex sources that couple to the deforming operator and the gaugino bilinear.
- > There is a naked curvature singularity.
- > Solution physically acceptable if $C_2 \leq C_1$ (according to Gubser criterion).
- > Proposed to be dual to a confining vacuum of $N = 1^*$.

 $\label{eq:main_state} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Remarks

- The QFT sources are complex. We need to generalize the solution to include the phases of the sources.
- > In QFT $\langle W^2 \rangle \sim m^3$, where m is the deformation parameter.
- It gauge/gravity duality we expect such relations to come from regularity, but there is no choice of the integration constants for which the solution is regular.
- There is also a computation that suggests that the spectrum contains a massless state [DeWolfe, Freedman (2000)]. Is this solution dual to a Coulomb vacuum?
- > A proposal for the 10d dual of $N = 1^*$ was made by [Polchinski, Strassler (2000)]. What is the relation to GPPZ?

 $\label{eq:model} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{ Conclusions} \end{array}$

The uplift of the GPPZ solution

- > We generalized the GPPZ solution to complex m and σ and uplfited it to 10d.
- > The phases of m and σ are accounted by a combination of a rotation in S^5 , which geometrizes the R-symmetry, and a rotation of $U(1) \in SL(2)_{IIB}$ (bonus U(1) [Gunaydin, Marcus (1985)] [Intriligator (1998)]).
- The 10d metric and axion-dilaton agree exactly with those in [Pilch, Warner (2000)].
- All *p*-form are turned on and the entire solution is given in terms of elementary functions.

- The solution is still singular but the singularity is milder in 10d than in 5d [in agreement with [Pilch, Warner (2000)]].
- > There is either a ring singularity in internal space (if $C_2 < C_1$) or both a radial singularity and an angular singularity (if $C_1 = C_2$).
- > Intriguingly, there are conformal frames where the singularity is even milder: there is a singularity only at one point on S^5 $(C_2 < C_1)$ or only in the radial direction $(C_1 = C_2)$.

 $\label{eq:model} \begin{array}{l} \mbox{Introduction}\\ \mbox{From QFT to SUGRA}\\ \mathcal{N}=1 \mbox{ deformations of } \mathcal{N}=4 \mbox{ SYM}\\ \mbox{GPPZ solution and its uplift}\\ \mbox{ Conclusions} \end{array}$

Near boundary expansion

- We computed the near-boundary expansion of all fields to sub-leading order, and found agreement with [Freedman-Minahan (2000)].
- Boundary conditions (non-normalizable modes) are the same as Polchinski-Strassler.
- Sub-leading terms are different from those in [Polchinski, Strassler (2000)]: the Polchinski-Strassler configuration does not solve the IIB equations of motion.

 $\label{eq:main_state} \begin{array}{l} \mbox{Introduction} \\ \mbox{From QFT to SUGRA} \\ \mathcal{N} = 1 \mbox{ deformations of } \mathcal{N} = 4 \mbox{ SYM} \\ \mbox{GPPZ solution and its uplift} \\ \mbox{Conclusions} \end{array}$

Is the solution supported by branes?

- We have explicitly checked that the IIB equations of motion hold at generic points.
- Checking for delta function sources in the field equations is more subtle.
- To diagnose possible delta function sources one may integrate the field equations against test functions.

The results so far are as follows:

- There are no 5- and 7-branes localized away from the position of the 5d singularity.
- There may still be branes localized at the position of the 5d singularity.

Introduction From QFT to SUGRA $\mathcal{N}=1$ deformations of $\mathcal{N}=4$ SYM GPPZ solution and its uplift Conclusions

Conclusions/Outlook

- > We classified $\mathcal{N} = 1$ deformations of $\mathcal{N} = 4$ SYM.
- We discussed how to obtain the supergravity potential for single-scalar sectors directly from the QFT.
- It would be interesting to extend this discussion in other cases where we understand the QFT dynamics.
- The results suggests the existence of single-scalar truncations of massive modes.
- > Extend to other dimensions. (The potential for $d = 3, \Delta = 1, 2$ appeared before in the literature.)

Introduction From QFT to SUGRA $\mathcal{N} = 1$ deformations of $\mathcal{N} = 4$ SYM GPPZ solution and its uplift Conclusions

Conclusions/Outlook

- > We uplifted the GPPZ solution to ten dimensionss.
- We should compute further observables to decide what this solution represents:
- Use the method Kaluza-Klein holography [KS, Taylor (2006)] to extract the expectation values of higher dimension chiral primaries.
- Compare with QFT expectations.
